No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 11, A

Sequence 51, Application US/08787738B
GENERAL INFORMATION:
APPLICANT: Notlan, Garry P
TILE OF INVENTION: METHODS FOR SCREENING FOR TRANSDOMINANT EFFECTOR
TILLE OF INVENTION: PEPTIDES AND RNA MOLECULES
TILLE REFERENCE: A-64259-1 correction
CURRENT FILING DATE: 2001-09-18
PRIOR APPLICATION NUMBER: 08/589,108
PRIOR PRIOR FILING DATE: 1996-01-23

This sequence represents a viral antigenic epitope of influenza virus hammagalutinin. The DNA sequence encoding this antigen may be included into a modified tobacco mosaic virus (TWV) cost protein gene or a modified movement gene. The modified infectious clone is used to transfect a plant which is then cultured such that the epitope may be recovered from the leaves. The epitope coding sequences are included into the coat protein or movement protein genes such that the translated product contains one or more amino acids immediatly adjacent to the product contains one or more amino acids immediatly adjacent to the product contains one or more amino acids immediatly adjacent to the product contains one or more amino acids immediatly adjacent to the product containing modified movement or coat proteins may be used in the method is esp. used for the production of heterologous proteins. The method is esp used for the production of peptides which cause an antigenic response in mammals, partic, for use in viral vaccines, or for generating a contraceptive immune response. The infectious clones may encode coat proteins for other plant viruses, or proteins conferring protein against insects and diseases.
                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Truncated; tobacco mosaic virus; TMV; movement protein; coat protein; frame shift; mutation; in-frame stop codon; antigen; mammal; viral vaccine; contraceptive; immune response; plant virus; insect.

DNA encoding the tag is fused to the FADD gene by PCR, downstream of a cytomegalovirus promoter-enhancer in plasmid pcDNA3HA-FADD. The reculting fusion protein is expressed in Escherichia coll and used in an assay to demonstrate in vivo association of FADD protein and Fas receptor via death domains. FADD DNA may be used therapy, and FADD protein or a corresponding antibody may be used to screen for agents modulating FADD pathway cellular functions and Fas-associated apoptosis, for use in therapy of e.g. AIDS, inflammation, leukaemla, myocardial infarction, degenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - for

This peptide comprises an epitope for an anti-haemagglutinin (HA) tag monoclonal antibody. It can be included in the sequence of a recombinant G protein-coupled receptor that is activated superiorly by a synthetic ligand, i.e. a RASSL (see AAW30298 and AAW30299), to facilitate ease of detection and purification. RASSLs are used in a novel method for selectively activating a target cell, providing direct, selective control of cellular proliferation, especially for amplification of transfected cells during gene therapy procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Selective activation of target cell expressing modified G protein coupled receptor - allows control of cellular proliferation, especially for amplification of transfected cells in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Transforming growth factor-beta activated kinase epitope HA-TAKI.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptides contain a first portion of 5-99 amino acids joined to a second portion contg. at least a functional domain of epimorphin. The first portion may be selected from the peptides 91ven in AAR92029 to AAR92036. The second portion may be full-length epimorphin (see AAR92037 to AAR92042 for human and mouse epimorphins). Fragments of epimorphins given in AAT16083 to AAT16090 are used in the produ. of modified epimorphins. The modified epimorphins are useful for the development of diagnosis and treatment of morphogenetic abnormalities of epithelial tissue or novel remedies for wounds, eg burns, after surgery and for artificial organs. They may also be used as components of cosmetics, hair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polypeptide containing an epimorphin functional domain - has possible benefits in epithelial tissue treatments, e.g. burns and for artificial organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                                                     ö
                                                                                                                                  The present sequence represents an epitope, HA-TAK1, of transforming growth factor-beta (TGF-beta) activated kinase, TRK-1. The DNA encoding TAK-1 is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated kinase by phosphorylation.
                                                                                       DNA encoding transforming growth factor-beta-activated kinase, TAK-1 - useful for studying the TGF-beta signal transmission system

The present sequence represents the HAI epitope tag of the pJG4-5 library plasmid used during the isolation of the E6AP-binding proteins. E6AP mediates ubiquitination and so the inactivation of e.g. p53 tumour suppressor. The E6AP-binding protein is likely to be involved in normal cell homeostasis and in the pathogenesis of proliferative and differentiation disorders, e.g. regulation of gene expression or the cell sycle, modification of cell surface receptors, biogenesis of ribosomes and DNA repair. The protein, which can optionally be generated in vivo by gene therapy, may useful in treatment and prevention of papilloma virus infected transformed cells and carcinoma,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; cell differentiation; survival; carcinoma; psoriasis; ubiquitination; p53; tumour suppressor; homeostasis; papilloma virus; epithelial cell; acne; icthyosis; aphthous ulcer; hair growth; antibody; cell proliferation.
                                                                This peptide sequence comprises a haemagglutinin epitope that can be attached to the N-terminus of a nucleic acid binding protein (NABP) such as a leucine zipper bZIP protein or bHith protein.

Claimed NABPs having an appended acidic extension peptide (see AAW00958-65) can regulate the function of a target nucleic acid or gene to which they are bound, and act as potent dominant-negative regulators of gene transcription, cell growth and cell proliferation. They can be used in cancer therapeutics, to treat diseases caused by eukaryotic microorganisms or by viruses, and as tools for drug development, rational drug design, and drug and gene therapies.

ö
and may also be used to regulate epithelial cell processes more generally, e.g. in cases of psoriasis, acne, icthyosis, aphthous ulcers. It may also be used to control wound healing, and inhibit growth of hair. It can also be used to generate antibodies which are used in immunoassays to determine the protein levels. The encoding nucleic acid as be used to prepare recombinant proteins and oligonucleotides useful as probes and primers for diagnostic detection of (mutant) mRNA for the protein in (transformed) cells, also for antisense therapy. It can also be used for the detection of mutations in EGAP-binding protein-encoding genes, mis-expression of these genes or mis-incorporation of the protein assess risk of disorders characterised by cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence represents a specifically claimed purification tag. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site:proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion

of a purification tag facilitates purification of the fusion protein. The proteinses site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA sequence encoding an influenza virus haemagglutinin (HA) epitope tag (AAM12385) and the murine Ig kappa-chain V-J2-C region signal peptide (AAM12384) was subcloned from a single chain antibody (SFV) contg. vector (pCR3.2) as an ECORV-Sall fragment and ligated with ECORV/Sall-digested pCR3.1.1. The resulting vector was used in the construction of eukaryotic expression vector pPhOx. TM (see also AAT63235). Expression of the HA epitope tag allowed detection of the expressed sFV by monoclonal antibody 12CA5. Vector pphOx.TM is used in novel methods for the identification and isolation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant antibodies capable of binding to two different antigenic sites, contain Fab fragments from the same or, pref. different antibodies, which are brought into association by complementary antibodies, which are brought into association by complementary interactive domains, esp. leucline zipper domains, which have been inserted into a region of the antibody heavy chain constant region. Recombinant proteins c-fos LZ/Fab OKT2 and c-jun LZ/Fab OKT3 showed ittle or no binding to normal lymphocytes when analysed individually but bound very clearly to the cells when mixed to form a homodimeric antibody. The labelled antibodies are useful for detecting a selected antigen (bound by the first or second Fab) in a biological sample or treatment of cancer and viral infections. AAW01661 is a 10-mer peptide tag derived from Influenza haemagglutinin. DNA encoding the 10-mer was cloned into lambda HC2 to provide a peptide tag which will be present on the heavy chain cloned into pHC2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bi:specific antibodies comprising two Fab fragments linked through leucine zipper - useful to detect selected antigen or to treat cancer and viral infections
                                                                                                                                                                                                                                                                                          monoclonal; recombinant; antibody; bispecific; antigenic site;

```
This represents an in-frame 12CA5 peptide epitope of the alpha chain of mouse leukaemia inhibitory factor (LIF) receptor (LIFR). The invention relates to interspecies LIFR alpha-chain chimeras. The chimeric polypeptide comprises (i) a heemopoietin domain, linked, bound or associated with (ii) an immunoglobulin (Ig)-like domain, such that the chimera can bind cytokines. The chimeric polypeptide specifically binds LIF, so is used to treat conditions that require antagonism of LIF, specifically inflammation, but more generally may be designed to bind other cytokines such as interleukins and colony-stimulating factors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Induction; intracellular aggregation; cytoplasmic tail; zeta chain; T cell receptor/CD3 complex; signal; transcription; reporter gene; homodimerization; Fas receptor; cell-specific apoptosis; Gall4; VP16; heterodimerization; primer.

This peptide comprises the influenza virus haemagglutinin epitope. A synthetic oligonucleotide (see AAV07684) encoding the epitope has been inserted into plasmid pyun563 (see AAV07705), which contains DNA encoding Mycobacterium tuberculosis recA inteln (see also AAV07705) inserted into an aph selectable marker gene and includes an internal BglII site. E. coli transformants showed a high splicing frequency. The invention provides novel vector constructs that include a DNA sequence encoding an inteln inserted into a selectable marker gene such as aph. DNA of interest can be cloned into a unique restriction site of the inteln, and the vector used as a vaccine or transformed into a vaccine vector. The vectors may also be used in methods of selecting translated open reading frames or genes, leading to the identification of protective antigens of
                                                                                                                                                         New vector constructs for selection of open reading frames - comprise origin of replication and DNA sequences encoding selectable marker, intein and regulatory elements for expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAW76736-W76764 are peptides used to design primers used in a novel method for inducing a biological process in a cell. The method can be used to induce the intracellular aggregation of the cytoplasmic tail of the zeta chain of the T cell receptor/CD3 complex, leading to signalling and transcription of a reporter gene. The method also has applications for the homodimerization of the cytoplasmic tail of the Fas receptor, leading to cell-specific apoptosis and for the heterodimerization of Gall and VP16, leading to direct transcription of a reporter gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing a biological process in a cell using ligand-induced gene expression for e.g. cell death - using DNA construct encoding ligand-binding domain and dimerisable protein domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The present sequence represents the 12CA5 epitope of haemagglutinin. It is recognised by the polyclonal rabbit antibody HA.11. The sequence was produced by annealing 2 primers encoding the present sequence. These were used to create a epitope tag at the end of human betal-adrenergic receptor (betal-AR) cDNA, which is used to create the transgene of the invention. The specification describes a transgenic animal, especially a mouse, which has incorporated into its genome a transgene comprising a heart tissue-specific promoter operatively linked to a coding sequence comprising betal-LAR, the transgene being expressed in at least the myocardium of the heart of the transgenic animal. The transgenic animal can be used as a model for heart muscle disease and heart failure in a mammal. The transgene can also be used for treating heart failure.
Transgenic mice as models for heart disease - having incorporated in their genome a heart tissue-specific promoter operatively linked to DNA coding for a beta-1-adrenergic receptor
                                                                                                                   Example 1; Page 15; 40pp; English.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 6, A Sequence 28, Sequence 19, Sequence 19, Sequence 10, Sequence 119, Sequence 17, Sequence 17, Sequence 14, Sequence 14, Sequence 11, Seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 31, Application US/08634060

Patent No. 5712136

GENERAL INFORMATION:

APPLICANT: Wickham, Thomas J.

APPLICANT: Wovesdi, Imre

APPLICANT: Rowesdi, Imre

APPLICANT: ROWENTION: THE ADENOVIRAL WEDIATED CELL TARGETING COMMANDED BY

TITLE OF INVENTION: THE ADENOVIRAL PENTON BASE PROTEIN

NUMBER OF SEQUENCES:

ADDRESSEE: Leydig, Voit 6 Mayer, Ltd.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
